

Maelstrom domain architecture (Homo sapiens, Q96JY0, 434 aa)

HMG-box residues 5–65; MSD residues 106/130–325 (boundary used for structural superposition)

DEDD (absent catalytic tetrad; substituted in H. sapiens, see legend)

Same DnaQ-H structural scaffold; independent taxa retain different subsets of the ancestral DEDD tetrad (Discussion), but the ECHC motif is conserved at 96–99% across all 81 taxa sampled here.
